

LeadRefinery — Website Design Prompt

Copy everything below the --- line into a fresh Claude chat. Attach your logo files if you want the system to anchor on the final mark.

ROLE

You are a senior product designer and frontend engineer. You've shipped marketing sites for Stripe, Plaid, and Ramp. You have strong opinions on industrial typography, restraint, and motion that rewards scroll. You understand that B2B sites are tools, not brochures — every pixel has to earn its place.

You are designing and building the LeadRefinery marketing website. This is not a disposable landing page. The visual system, component library, and design tokens you establish here will evolve directly into the standalone webapp (auth, upload, dashboard, results, feedback).

Design for the marketing site, but architect for the app.

COMPANY BRIEF

LeadRefinery is an intelligence platform for the Merchant Cash Advance (MCA) industry. We take raw broker lead lists — names, EINs, addresses — and run them through a data enrichment and machine learning pipeline that returns scored, prioritized, context-rich intelligence. Brokers stop calling blind. Funders stop eating bad submissions.

What we actually do, in plain terms:

- Ingest a broker's lead list (CSV, CRM pull, API)
- Enrich each record with real-world event signals — public filings, business activity, funding history, operational changes, and the kinds of triggers that signal *it's time to have a conversation*
- Score every lead into five priority tiers: **P1** → **P5**
- Return intelligence: who to call first, what the story is, what funding they've taken, what's about to renew
- Push results into the broker's CRM or portal

Who we serve (in priority order):

1. **Solo brokers and small ISOs** (1–25 brokers) — our pilot ICP
2. **Mid and large ISOs** (25+ brokers) — next expansion
3. **MCA funders** — different product surface, same engine, eventually
4. **Adjacent verticals** (equipment leasing, commercial insurance) — long-horizon

What makes us different:

- **Hundreds of real-time data fields** feeding every scoring decision
- **Proprietary infrastructure** — not a reseller, not a wrapper on someone else's API
- **A waterfall enrichment pipeline** built to recover signal where others give up
- **Tested, trained, and proven** — our models learn from every outcome our clients report
- **We work with every list you already have** — new buys, old buys, aggregator data, CRM records, lists you've already called through once. We resurrect value from data you've already paid for.
- We don't just tell you **who to call and who not to call**. We tell you **when to call, and why**.

That last line is the one-sentence product pitch. Anchor the site around it. The *when* and *why* are the real unlock — the rest of the industry stops at *who*.

BRAND POSITION

Two principles sit underneath this brand. Both should read quietly through the whole site — neither should ever become a headline. They are the *posture* the site communicates, not the pitch.

Principle 1: The outsiders building for the inside

The founders — Chase and Kolin — **did not come from MCA**. They came from data engineering, machine learning, and building platforms. They spent the last stretch embedded with brokers and funders, learning the industry from the people actually working it, and they built what they couldn't find: a real intelligence layer for a market that still runs on gut feel and stale lists.

- **Fresh eyes.** MCA has been served the same playbook for a decade. We're technology people who looked at the industry, saw the gap, and built a different kind of tool.
- **Respectful, not lecturing.** Brokers know their market. We're here to hand them better signal so they can do what they already do, faster and with more edge.
- **Disruptive, not dismissive.** The disruption is in the technology, not the attitude. Real-time signal infrastructure, machine-learned scoring, and a waterfall pipeline is

genuinely new to this industry. Let the product be the disruption; let the tone stay confident and grounded.

- **Builders, not marketers.** The site should feel like it was made by engineers with taste, not an agency. That's an advantage — brokers are sick of being sold to.

Principle 2: Complement, don't compete

We are not another lead provider. We do not sell lists, aggregate contacts, or try to replace the vendors a broker is already paying. Every broker has lists — from aggregators, from past campaigns, from their CRM, from lists they've already called through once and set aside. Most of that data is treated as spent. We treat it as **inventory**.

LeadRefinery is the intelligence layer that sits *on top* of everything a broker already has — new lists, old lists, dead lists, CRM data, aggregator buys. We surface the records worth calling *now*, from data the broker already owns, and we resurrect sunk cost by finding value in lists that looked tapped out.

- **We work with your lead providers, not against them.** Keep the vendors that work for you. We make every list you run through us hit harder.
- **Old lists are not dead lists.** The filings, signals, and events that make a lead worth calling change every week. A list that was cold in January is full of new P1s by April. We re-score, re-surface, and re-rank.
- **New intelligence for lists you already own.** The pitch is resurrection, not replacement. You've already paid for the data. We help you get the last calls out of it.
- **Channel-safe.** This positioning protects the path to partnerships with lead aggregators themselves — they can resell our scoring to their customers without cannibalization.

Where these principles show up on the site:

- A short "Why we built this" section — one paragraph, not a bio page. Honest about coming from outside the industry. Confident about what that outside perspective lets us see.
- The "problem we solve" section should frame the problem as *"your lists are doing less than they could,"* not *"your lead providers are letting you down."*
- The FAQ should directly address "Do I need to switch lead providers?" with a clear no.
- Tone throughout: technology-first, broker-respectful, allergic to hype, and never adversarial to the rest of the broker's stack.

AUDIENCE: WHO WE'RE TALKING TO

MCA brokers are not SaaS buyers. They are:

- Phone-first, hustle-driven, outcome-obsessed
- Skeptical of "platforms" — they've been sold bad lead lists for a decade
- Fluent in: UCC, stacking, backdoor, position, paper, funder, ISO, submission, payback, factor rate, holdback, renewal window
- Bored by: "leverage," "synergize," "empower," "unlock," "revolutionize," "AI-powered," "next-generation"
- Persuaded by: concrete numbers, real workflow fit, and the sense that you actually work in their world

Voice test: If a copy line would sound natural coming out of a broker's mouth at 9 AM on a Tuesday — *with a little tech confidence behind it* — it stays. If it sounds like a LinkedIn post from a VP of Growth, it dies.

AI and machine learning should show up in the voice, but like a scalpel, not a sledgehammer. We're proud of the technology — we just don't want to sound like every other "AI-powered" pitch that's landed in a broker's inbox this year. Use technical credibility sparingly and specifically: *"trained on your outcomes," "models that learn every week," "machine-learned scoring," "AI that reads the signals you can't see."* Avoid the generic stuff: *"AI-powered," "next-generation AI," "powered by GPT," "revolutionary machine learning."*

Examples of on-voice copy:

- "Stop dialing blind."
- "P1 leads in your CRM before coffee."
- "We score the list. You work the phone."
- "Who to call. When to call. Why to call."
- "Your list, refined."
- "Machine-learned scoring. Broker-tested outcomes."
- "Hundreds of signals. One ranked list. Zero guesswork."
- "AI that actually reads the filings."
- "Models trained on real broker outcomes — yours included."
- "From raw list to ranked leads in hours."
- "Keep your lead providers. We'll make every list work harder."
- "The list you already bought is not done yet."
- "Old list. New signals. Fresh calls."
- "Resurrect what you've already paid for."
- "We sit on top of your stack, not in place of it."

Examples of off-voice copy (do not use):

- "Leverage AI-driven intelligence to supercharge your pipeline."
- "Unlock the power of data."

- "Our proprietary machine learning platform empowers brokers to..."
- "Revolutionize your lead management workflow."
- "Next-generation AI for the modern MCA professional."

BRAND SYSTEM

Colors (locked, do not substitute)

Token	Hex	Usage
Petroleum Night	#06090F	Primary dark surface, hero backgrounds, footer
Refined Amber	#E8A225	Primary accent — flare, CTAs, scoring highlights
Pipeline Steel	#4A8FAD	Secondary accent — pipes, raw inputs, cool states
Refined Cream	#F2EDE3	Light surface, text on dark, refined output state

Color logic (use this, it's the hidden narrative):

- **Steel** = raw, cold, unprocessed input
- **Amber** = the flare, the refinement, the value unlocking
- **Cream** = the finished, refined output
- **Night** = the platform, the infrastructure, the always-on

Hero sections can literally transition from Steel → Amber → Cream as the user scrolls. Let the color *tell the refining story*.

Typography

- **Display / Headlines:** a confident industrial sans — think the feel of stenciled pipe labels or refinery signage. Good choices: **Space Grotesk, Inter Tight, General Sans, or Geist**. Weight 600–800. Tight tracking. Occasional uppercase for section labels.
- **Body:** neutral, readable sans — **Inter, Geist, or the system stack**. 16–18px. 1.55 line height minimum.
- **Mono accents:** use a monospace font (**JetBrains Mono, Geist Mono, or IBM Plex Mono**) for section numbers, data labels, inline code-like callouts (P1, UCC, EIN →

matched), and footer meta. Mono is the "engineering is underneath this" signal. Use it sparingly — it's seasoning, not the meal.

Logo direction

The wordmark in progress uses the **"L" in LEAD as a smokestack** (with staggered flare bubbles rising off the top) and the **"Y" in REFINERY connected back to the stack via an industrial pipe**. Treat this as the brand anchor if provided. If no logo file is attached, render a placeholder in the same spirit: a monospace **LEADREFINERY** wordmark with an amber flare dot above the **L**.

DESIGN LANGUAGE: THE METAPHOR LIBRARY

This is the visual vocabulary. Pull from these — **subtly, not theatrically**. The goal is for a broker to feel the vibe without being able to articulate why it feels different.

The refinery side

- **Smokestacks and flare stacks** — vertical columns, staggered bubbles of rising flare, silhouette shapes
- **Distillation towers** — tall cylindrical columns with tapped outputs at different heights (maps naturally to P1–P5 tiers)
- **Pipes, elbow joints, valves, pressure gauges** — especially as section dividers, card frames, and icon scaffolding
- **Steam, vapor, flare glow** — amber light leaks, soft radial gradients, subtle column-top haze

The data/ETL side

- **Flowing pipelines** — data moving left to right through a connected series of stages:
Raw → Enrich → Score → Route
- **Conveyor belts** — a belt of "records" crossing the screen, each one gaining fields (URL, address, EIN, signals) as it moves
- **P&ID schematic lines** — thin-stroke technical diagrams (Piping & Instrumentation Diagram style) as decorative backgrounds. These read as "engineered," not "designed."
- **Gauges, dials, and signal bars** — for metrics and scoring visuals

The manufacturing / process side

- **Raw → Refined** transformation — the core product narrative, shown visually in hero and section transitions
- **Batch counters, throughput meters** — small stats with mono labels

- **Stamped labels** — section headers that feel like they were stenciled on a shipping crate

Sneaky design elements (the good ones)

These are the details that reward attention. Scatter 5–8 across the site. Do not do all of them.

1. **Hero pipeline animation** — a horizontal pipe across the hero with lead records (cards) flowing through, gaining enrichment labels at each junction, emerging as ranked P1/P2 tiles.
2. **Section dividers as pipe segments** — instead of a plain `<hr>`, use a thin steel pipe with a valve or elbow joint.
3. **Section numbers in a stenciled mono style** — § 01, § 02, etc., set in amber mono, like stamped equipment tags.
4. **Scroll-triggered flare ignition** — CTA buttons faintly glow amber as they enter the viewport, like a flare catching.
5. **Pressure-gauge stat cards** — numbers (e.g., "87 signals," "5 priority tiers") rendered inside circular gauge frames with a tick-mark ring.
6. **Conveyor belt band** — a thin strip between sections showing an endless scroll of "record → refinement → score" mini-cards.
7. **Loading states that drip** — if anything takes a beat to load (interactive demos, form submissions), replace the generic spinner with a subtle drip animation: liquid falling through a pipe, pooling, filling a meter.
8. **Steel-to-amber hover states** — interactive elements start in Pipeline Steel and warm to Refined Amber on hover, as if being processed.
9. **Valve-style toggles** — where you have on/off or tabs, render them as industrial valves rotating 90°.
10. **Faint P&ID watermark** — a very low-opacity schematic diagram in the footer or section backgrounds, like blueprints showing through.

Restraint rule: If a visitor notices the refinery theme within 2 seconds of landing, you've overdone it. It should read as "distinctive, engineered, serious" first, and reveal the theme on second glance.

YOUNGER FEEL, NOT EDGY

Chase wants the brand to feel like it was built in 2026, not 2010. That means:

- Generous whitespace, not cramped enterprise density
- Sharp rectangular geometry, subtle rounded corners (6–8px, not 20px)
- High contrast — real blacks and real whites, confident amber accents
- Motion that feels considered, not decorative — everything moves for a reason

- A touch of humor in microcopy (e.g., empty states, 404 pages, loading messages) — dry, knowing, not try-hard
- **What to avoid:** glitch effects, neon, crypto-coded gradients, Y2K revival, brutalist maximalism, AI-generated chrome blobs, overly glassmorphic panels

Think: **Linear, Vercel, Ramp, Mercury** aesthetic discipline, with an industrial/oil-and-steel soul instead of their pure-digital feel.

SITE ARCHITECTURE

Build a single-page site with the following sections, in order. Use semantic section tags, anchor navigation, and a sticky minimal top nav.

1. Hero

- Headline (one line, max 8 words) — e.g., *"Your list, refined."* or *"Stop dialing blind."*
- Subhead (one sentence, ~15 words) — plain-English explanation of what we do for brokers
- Primary CTA: "Score my list" / "Start the pilot"
- Secondary CTA: "See how it works"
- Background: animated pipeline with records flowing through enrichment → scoring → ranked output

2. The problem we solve ("Your lists are doing less than they could")

- Frame: this is not a "lead providers are bad" section. It's a "you're leaving calls on the table" section.
- 2–3 short punchy statements: brokers are dialing without context, running old lists once and shelving them, and have no way to know which records are worth calling *today*
- Optional: a small visual showing a "raw list" (a plain row of records) transforming into a ranked list with signal badges, priority tiers, and timing callouts
- Subtle emphasis: every broker already has lists sitting in a CRM, a spreadsheet, or a dead folder. Most of what's there is still worth something — nobody's looking at it the right way.

3. How it works (the refinery process)

- Visual: 4-stage horizontal pipeline — *Ingest* → *Enrich* → *Score* → *Deliver*

- Each stage gets a short description (1 sentence) and a small iconographic treatment
- This is where the ETL/refinery metaphor gets its strongest moment

4. **What you get** (the intelligence output)

- Show a mocked-up P1–P5 tier table or card stack — each tier has a color, a short description, and a sample signal callout
- Emphasize: priority, signal context, CRM-ready delivery

5. **Proof / social / trust bar**

- Placeholder for pilot client logos (leave the slots, label them clearly so Chase can swap in later)
- 2–3 stat callouts in gauge-style frames: signal count, tier count, coverage rate

6. **Why we built this** (the outsider/builder angle — short and honest)

- One paragraph, not a bio page
- The angle: we didn't come from MCA. We came from data and machine learning. We spent time learning the industry from the brokers and funders actually running deals, and we built what we saw was missing.
- Tone: confident, grounded, not self-important
- Visual treatment: restrained — a small section, maybe a thin pipe-segment divider, optional portrait slots (leave placeholders)

7. **Pricing preview** (light touch — not a full pricing page)

- Two tiers: "Pilot" and "Scale" — keep it vague, push toward "Talk to us"
- Avoid committing to specific dollar amounts; use placeholder ranges

8. **For funders** (one section, softer treatment)

- Short paragraph: we also serve funders with stacking detection, submission enrichment, and portfolio risk
- Separate CTA: "Funder inquiries"

9. **FAQ** (4–6 questions max, broker-coded)

- **"Do I need to switch lead providers?"** — answer is a clear no. This question is canonical; include it. Frame the answer around: keep what's working, we score whatever you send us, old lists and new lists both.

- Other examples: "Do I need to change CRMs?" / "What format do I send my list in?" / "How fast do I get results?" / "What data do you pull from?" / "Can I re-score an old list?"

10. CTA band (just before footer)

- Full-width amber or dark section with a single clear action
- e.g., "Ready to refine your list? [Start a pilot]"

11. Footer

- Minimal: logo, nav, contact, social, legal
- Faint P&ID schematic watermark in the background
- LeadRefinery LLC, copyright, location (Florida)

WEBAPP-FORWARD ARCHITECTURE

This is critical: the marketing site is draft one of the app. Architect accordingly.

- **Design tokens** (colors, type scale, spacing scale, radius, shadows) must be defined as CSS variables or Tailwind config — reusable wholesale in the app
- **Component vocabulary** should anticipate the app: Button, Card, Badge, Tag, Stat, Table, EmptyState, Tier/Priority Pill, SignalChip, StatusDot
- **Layout system** should accommodate both marketing (full-bleed, centered max-width) and app shells (sidebar + main content + detail pane)
- **Navigation** should be structured so the same top-nav component can later host authenticated states (avatar, workspace switcher)
- **Motion system** should define standard timing/easing tokens used everywhere — the marketing hero animation and the app's "scoring in progress" state should feel related

Include in the output: a short "App preview" section or a teaser card showing what the logged-in dashboard will feel like. Use the same visual language (pipeline viz, tier tiles, signal chips). This both sells the vision *and* proves out the design system.

COPY DIRECTION

- **Headlines:** 8 words max. Confident, declarative, operator-voice.
- **Subheads:** one sentence. Plain English. No jargon for jargon's sake.
- **Body:** short paragraphs. Never more than 3 sentences in a row.

- **CTAs:** verbs in imperative mood. "Score my list," "Start the pilot," "See a sample report."
- **Microcopy:** dry, knowing. A 404 page that says "This lead didn't score." is worth more than five taglines.

Write all copy yourself, but keep it minimal and replaceable. Use `{{PLACEHOLDER}}` tokens sparingly and only where Chase will clearly need to fill in a specific number, logo, or quote.

TECHNICAL DELIVERY

- Output as a **single HTML file** with Tailwind CDN (or inline styles if Tailwind unavailable) and vanilla JS / Alpine for interactivity. No build step.
 - **OR** output as a **single React JSX artifact** using Tailwind core utility classes, if the environment supports it. Default exports, no required props.
 - Mobile-responsive from the start — brokers check things on their phones.
 - All animations should be CSS-based or lightweight JS. No heavy libraries. Respect `prefers-reduced-motion`.
 - Use real, accessible semantic HTML — `<nav>`, `<main>`, `<section>`, proper heading hierarchy, `aria-labels` where needed.
 - Inline the SVGs for pipes, gauges, conveyor elements — keep them editable.
-

WHAT SUCCESS LOOKS LIKE

When Chase shows this to a broker:

- The broker scrolls to the end without bouncing
- They understand what LeadRefinery does within 10 seconds
- They say something like *"this actually looks like it's built for us"*
- They don't notice the refinery theme on first pass — they notice it on second
- They click the primary CTA

When Chase shows this to a designer or engineer:

- They recognize the discipline — token system, component vocabulary, motion considered
 - They can see the path from marketing site to app
-

BEGIN

Start with a quick design plan: what metaphors you're pulling forward, what you're holding back, and what the core hero moment looks like. Then build.
